(54) **HYDROXAMIC ACID DERIVATIVE BASED ON AROMATIC SULFONAMIDE.**

(57) A novel hydroxamic acid derivative containing a compound represented by general formula (I) or a pharmaceutically acceptable salt thereof as the active ingredient, which has activities of inhibiting cell growth, vascularization, etc.. It has activities of inhibiting hemangioendothelial cell growth and the development of a lymphocyte adhesion factor, and detransformation by ras gene, thus inhibiting cell growth and being efficacious against inflammation and tumor.

EP 0 570 594 A1

Technical Field

The present invention relates to novel hydroxamic acid derivatives which show activities such as cell growth inhibitory activity, vascularization inhibitory activity and the like and are useful for prophylaxis and therapy of various inflammatory diseases, tumors, arteriosclerosis, peptic ulcer, diabetic retinopathy or the like.

Background Art

In higher animals, a lot of tissues and organs have individual unique cell growth system, which are controlled by various regulatory mechanisms.

The participation of cell growth factors capable of effecting the positive control of cell growth of various cells has been shown and there have been reports which suggest the existence of relationships between various diseases and an abnormal growth of cells induced by an excessive production of cell growth factors and/or an excessive reaction to them. For example, tumor cells release a certain substance(s) capable of accelerating vascularization to maintain their own growth. It has been revealed that the vascularizing factor has a potent growth accelerating effect on vascular endothelial cells, and such vascularization can be also observed during chronic inflammation, arteriosclerosis and peptic ulcer. Although there are some compounds known to inhibit the vascularization, for example, DS4152 and the like (see, Japanese Patent Publication (KOKAI) No. 63-119500), the activity is not sufficient.

Furthermore, lymphocytes take an important role in case of inflammation, during which an adhesion phenomenon is observed between lymphocytes and vascular wall via an adhesive molecules expressed on the vascular endothelial cells. Therefore, it has been considered that inflammation can be prevented by inhibiting the expression of adhesive molecules on the vascular endothelial cells or by directly interfering the adhesive reaction.

On the other hand, the discovery of tumor genes has promoted the development of antitumor agents. The tumor gene can be classified in several groups represented by src, ras, myc gene or the like. However, conventional antitumor agents inhibited the growth of normal cells as well because they had been developed as the result of a research which uses as an index the inhibitory effects against DNA synthesis, RNA synthesis, protein synthesis or the activity of factors participating in the cell growth. Therefore, the development of antitumor agents has been carried out on the basis of a different index directed to substances that inhibit the growth of tumor cells not normal cells. It was found that when azatyrosine is administered to normal and transformed NIH 3T3 cells, the latter having been transformed by the introduction of ras gene activated by the mutation of No. 61 amino acid glutamine to leucine, the growth of the transformed cells is specifically inhibited. It was also observed that about 85% of transformed cells were converted into flat revertant cells morphologically similar to normal cells after the administration of azatyrosine. It was proposed that, in the revertant cells, the expression of gene participating in the conversion into normal cells is activated [Cancer and Chemotherapy, vol. 17 (3): part II, 500 - 501, 1990].

As is easily anticipated from the above, if a drug that does not react on normal cells but specifically does on and detransform cells transformed by, for example, ras gene, and effects the detransformation is discovered, such a drug can provide an excellent antitumor agent. Accordingly, the development of such drugs has been desired.

Disclosure of the Invention

The present invention provides novel hydroxamic acid derivatives which have three kinds of activities, namely (1) inhibitory activity against the growth of vascular endothelial cells, (2) inhibitory activity against the expression of lymphocyte adhesive factors, and (3) detransforming activity by ras gene, and inhibit the cell growth and are effective on inflammation and tumor.

The present inventors have made an intensive research in view of the circumstances above and have found that the compounds of the general formula as shown below possess inhibitory activities against the growth of endothelial cells, lymphocytes, tumor cells or the like, and vascularization inhibitory, anti-inflammatory and antitumor activities.

Thus, the present invention relates to a compound of the formula (I)

wherein [A] represents each optionally substituted aromatic ring or aromatic heterocyclic ring; A represents hydrogen or each optionally substituted aryl or aromatic heterocyclic ring group; B represents a single bond or a bivalent group of $-\text{B}_1-\text{B}_2-$, wherein B_1 represents $-\text{CO}-$ or $-\text{SO}_2-$ and B_2 represents alkylene, alkenylene, alkyleneoxy or alkenyleneoxy; X represents optionally substituted alkylene, said alkylene optionally containing a hetero atom(s) selected from O, S or N in the chain and further optionally containing an unsaturated bond(s); Y represents a single bond, a hetero atom or optionally substituted alkylene, said alkylene optionally containing a hetero atom(s) in the chain and optionally containing an unsaturated bond(s); and X and the nitrogen atom adjacent to Y may taken together form a 5 or more membered heterocyclic ring containing nitrogen atom(s) represented by the formula below:

R^1 , R^2 and R^3 each independently represents hydrogen or optionally substituted lower alkyl group or aryl group or pharmaceutically acceptable salts thereof.

Best Mode for Effecting the Invention

Throughout the present specification, the term aromatic ring means benzene, naphthalene, anthracene and phenanthrene, each of which may have one or more substituents selected from alkyl, hydroxy, alkoxy, aryloxy, acyloxy (alkanoyloxy, aroyloxy, etc.), carboxy, ester (alkoxycarbonyl, aralkoxycarbonyl, etc.), cyano, amino, mono- or di-substituted amino, hydrazino, hydroxyamino, alkoxyamino, halogen (fluorine, chlorine, bromine and iodine), nitro, formyl, acyl (alkanoyl, aroyl, etc.), (thio)carbamoyl, (thio)carbamoxyloxy, (thio)ureide, sulfonamide, mono- or di-substituted sulfonamide, sulfonic acid, halogenoalkyl, hydroxyalkyl, alkoxyalkyl, acyloxyalkyl, nitroalkyl, (acyl)aminoalkyl, cyanoalkyl and carboxyalkyl. The alkoxy means a straight chained alkoxy having 1 - 6 carbon atoms, for example, methoxy, ethoxy, propoxy, butoxy, pentyloxy, hexyloxy and the like.

The aromatic heterocyclic ring means a 5 - 6 membered ring containing one or more atoms selected from oxygen, sulfur and nitrogen atoms on the ring, said ring being optionally condensed with a carbon ring or other heterocyclic ring.

Examples include pyrrole, indole, carbazole, imidazole, pyrazole, benzimidazole, pyridine, quinoline, isoquinoline, acridine, phenanthridine, pyridazine, pyrimidine, pyrazine, cinnoline, phthaladine, quinazoline, naphthylidine, quinoxaline, 1, 3, 5-triazine, 1, 2, 4-triazine, 1, 2, 3-triazine, pteridine, isoxazole, benzisoxazole, oxazole, benzoxazole, 1, 2, 3-oxadiazole, 1, 2, 4-oxadiazole, 1, 2, 5-oxadiazole, 1, 3, 4-oxadiazole, benzoxadiazole, isothiazole, benzisothiazole, thiazole, benzthiazole, 1, 2, 3-thiadiazole, 1, 2, 4-thiadiazole, 1, 2, 5-thiadiazole, 1, 3, 4-thiadiazole, benzthiadiazole, furan, benzofuran, thiophene, benzothiophene, and the like. These heterocyclic rings may be substituted by one or more substituents selected from alkyl, hydroxy, alkoxy, carboxy, ester (alkoxycarbonyl, aralkoxycarbonyl, etc.), cyano, amino, mono- or di-substituted amino, hydrazino, hydroxyamino, alkoxyamino, halogen, nitro, formyl, acyl (alkanoyl, aroyl, etc.), (thio)carbamoyl, (thio)carbamoxyloxy, (thio)ureide, sulfonamide, mono- or di-substituted sulfonamide, sulfonic acid, halogenoalkyl, hydroxyalkyl, alkoxyalkyl, acyloxyalkyl, nitroalkyl, (acyl)aminoalkyl, cyanoalkyl, carboxyalkyl and the like.

Examples of aryl group include phenyl, naphthyl, anthryl, phenanthryl and the like. These groups may have one or more substituents selected from alkyl, hydroxy, alkoxy, aryloxy, acyloxy (alkanoyloxy, aroyloxy, etc.), carboxy, ester (alkoxycarbonyl, aralkoxycarbonyl, etc.), cyano, amino, mono- or di-substituted amino, hydrazino, hydroxyamino, alkoxyamino, halogen, nitro, formyl, acyl (alkanoyl, aroyl, etc.), (thio)carbamoyl, (thio)ureide, sulfonamide, mono- or di-substituted sulfonamide, sulfonic acid, halogenoalkyl, hydroxyalkyl, alkoxyalkyl, acyloxyalkyl, nitroalkyl, (acyl)aminoalkyl, cyanoalkyl, carboxyalkyl and the like.

The term aromatic heterocyclic ring group means a 5 - 6 membered cyclic group containing one or more atoms selected from oxygen, sulfur and nitrogen atoms on the ring, said ring being optionally condensed with a carbon ring or other heterocyclic ring.

Examples include pyrrolyl, indolyl, carbazoyl, imidazolyl, pyrazolyl, benzimidazolyl, pyridyl, quinolyl, isoquinolyl, pyridazinyl, pyrimidinyl, pyrazinyl, cinnolyl, phthalidinyl, quinazolinyl, naphthylidinyl, quinoxalyl, phenazinyl, 1, 3, 5-triazinyl, 1, 2, 4-triazinyl, 1, 2, 3-triazinyl, isoxazolyl, benzisoxazolyl, oxazolyl, benzoxazolyl, 1, 2, 3-oxadiazolyl, 1, 2, 4-oxadiazolyl, 1, 2, 5-oxadiazolyl, 1, 3, 4-oxadiazolyl, benzoxadiazolyl, isothiazolyl, benzisothiazolyl, thiazolyl, benzthiazolyl, 1, 2, 3-thiadiazolyl, 1, 2, 4-thiadiazolyl, 1, 2, 5-thiadiazolyl, 1, 3, 4-thiadiazolyl, benzthiadiazolyl, furyl, benzfuryl, thienyl, benzothienyl and the like. These cyclic groups may be substituted by one or more substituents selected from alkyl, hydroxy, alkoxy, carboxy, ester (alkoxycarbonyl, aralkoxycarbonyl, etc.), cyano, amino, mono- or di-substituted amino, hydrazino, hydroxyamino, alkoxyamino, halogen, nitro, formyl, acyl (alkanoyl, aroyl, etc.), (thio) carbamoyl, (thio) carbamoyloxy, (thio) ureide, sulfonamide, mono- or di-substituted sulfonamide, sulfonic acid, halogenoalkyl, hydroxyalkyl, alkoxyalkyl, acyloxyalkyl, nitroalkyl, (acyl) aminoalkyl, cyanoalkyl, carboxyalkyl and the like.

The alkylene in the "alkylene" or "alkyleneoxy" in the definition of B₂ means alkylene of 1 - 8 carbon atoms, preferably alkylene of 1 - 6 carbon atoms such as methylene, ethylene, propylene, butylene, pentylene, amylene, hexylene, heptylene, octylene and the like.

The alkenylene in the "alkenylene" or "alkenyleneoxy" in the definition of B₂ means alkenylene of 2 - 8 carbon atoms, preferably alkenylene of 2 - 6 alkenylene having one or more double bonds in the chain. Examples of the alkenylene available are vinylene, 1-propenylene, 2-propenylene, 1-butenylene, 2-butenylene, 3-butenylene; 1, 3-butadienylene, 1-pentenylene, 2-pentenylene, 3-pentenylene, 4-pentenylene, 1, 3-pentadienylene, 1, 4-pentadienylene, 2, 4-pentadienylene, 1-hexenylenylene, 2-hexenylenylene, 3-hexenylenylene, 4-hexenylenylene, 5-hexenylenylene, 1, 3-hexadienylene, 1, 4-hexadienylene, 1, 5-hexadienylene, 2, 4-hexadienylene, 2, 5-hexadienylene, 3, 4-hexadienylene, 3, 5-hexadienylene, 1, 3, 5-hexatrienylene, 1-heptenylenylene, 2-heptenylenylene, 3-heptenylenylene, 4-heptenylenylene, 5-heptenylenylene, 6-heptenylenylene, 1, 3-heptadienylene, 1, 4-heptadienylene, 1, 5-heptadienylene, 1, 6-heptadienylene, 2, 4-heptadienylene, 2, 5-heptadienylene, 2, 6-heptadienylene, 3, 5-heptadienylene, 3, 6-heptadienylene, 4, 6-heptadienylene, 1, 3, 5-heptatrienylene, 2, 4, 6-heptatrienylene, 1-octenylenylene, 2-octenylenylene, 3-octenylenylene, 4-octenylenylene, 5-octenylenylene, 6-octenylenylene, 7-octenylenylene, 1, 3-octadienylene, 1, 4-octadienylene, 1, 5-octadienylene, 1, 6-octadienylene, 1, 7-octadienylene, 2, 4-octadienylene, 2, 5-octadienylene, 2, 6-octadienylene, 2, 7-octadienylene, 3, 5-octadienylene, 3, 6-octadienylene, 3, 7-octadienylene, 4, 6-octadienylene, 4, 7-octadienylene, 5, 7-octadienylene, 1, 3, 5-octatrienylene, 1, 3, 6-octatrienylene, 1, 3, 7-octatrienylene, 1, 4, 6-octatrienylene, 1, 4, 7-octatrienylene, 1, 5, 7-octatrienylene, 2, 4, 6-octatrienylene, 2, 4, 7-octatrienylene, 2, 5, 7-octatrienylene, 1, 3, 5, 7-octatetraenylene and the like.

The lower alkyl means alkyl of 1 - 8 carbon atoms, preferably alkyl of 1 - 6 carbon atoms such as methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl and the like. Said alkyl may be substituted by one or more substituents selected from alkyl, hydroxy, alkoxy, carboxy, ester (alkoxycarbonyl, aralkoxycarbonyl, etc.), cyano, amino, mono- or di-substituted amino, hydrazino, hydroxyamino, alkoxyamino, halogen, nitro, formyl, acyl (alkanoyl, aroyl, etc.), (thio)carbamoyl, (thio)carbamoyloxy, (thio)ureide, sulfonamide, mono- or di-substituted sulfonamide, sulfonic acid, halogenoalkyl, hydroxyalkyl, alkoxyalkyl, acyloxyalkyl, nitroalkyl, (acyl)aminoalkyl, cyanoalkyl, carboxyalkyl and the like.

The optionally substituted alkylene represented by X means alkylene of 1 - 15 carbon atoms, preferably alkylene of 2 - 10 carbon atoms, more preferably alkylene of 2 - 8 carbon atoms such as methylene, ethylene, propylene, butylene, pentylene, amylene, hexylene, heptylene, octylene, nonylene, decylene, undecylene, dodecylene, tridecylene, tetradecylene, pentadecylene and the like.

Further, the alkylene represented by Y means alkylene of 1 - 6, preferably 1 - 4 carbon atoms.

Furthermore, the alkylene represented by X and Y may form alkenylene or alkynylene, containing one or more double bonds and/or one or more triple bonds in the chain. Examples of the alkenylene available are vinylene, 1-propenylene, 2-propenylene, 1-butenylene, 2-butenylene, 3-butenylene, 1, 3-butadienylene, 1-pentenylene, 2-pentenylene, 3-pentenylene, 4-pentenylene, 1, 3-pentadienylene, 1, 4-pentadienylene, 2,

4-pentadienylene, 1-hexenylene, 2-hexenylene, 3-hexenylene, 4-hexenylene, 5-hexenylene, 1, 3-hexadienylene, 1, 4-hexadienylene, 1, 5-hexadienylene, 2, 4-hexadienylene, 2, 5-hexadienylene, 3, 4-hexadienylene, 3, 5-hexadienylene, 1, 3, 5-hexatrienylene, 1-heptenylene, 2-heptenylene, 3-heptenylene, 4-heptenylene, 5-heptenylene, 6-heptenylene, 1, 3-heptadienylene, 1, 4-heptadienylene, 1, 5-heptadienylene, 1, 6-heptadienylene, 2, 4-heptadienylene, 2, 5-heptadienylene, 2, 6-heptadienylene, 3, 5-heptadienylene, 3, 6-heptadienylene, 4, 6-heptadienylene, 1, 3, 5-heptatrienylene, 2, 4, 6-heptatrienylene, 1-octenylene, 2-octenylene, 3-octenylene, 4-octenylene, 5-octenylene, 6-octenylene, 7-octenylene, 1, 3-octadienylene, 1, 4-octadienylene, 1, 5-octadienylene, 1, 6-octadienylene, 1, 7-octadienylene, 2, 4-octadienylene, 2, 5-octadienylene, 2, 6-octadienylene, 2, 7-octadienylene, 3, 5-octadienylene, 3, 6-octadienylene, 3, 7-octadienylene, 4, 6-octadienylene, 4, 7-octadienylene, 5, 7-octadienylene, 1, 3, 5-octatrienylene, 1, 3, 6-octatrienylene, 1, 3, 7-octatrienylene, 1, 4, 6-octatrienylene, 1, 4, 7-octatrienylene, 1, 5, 7-octatrienylene, 2, 4, 6-octatrienylene, 2, 4, 7-octatrienylene, 2, 5, 7-octatrienylene, 1, 3, 5, 7-octatetraenylene, 1-nonenylene, 2-nonenylene, 3-nonenylene, 4-nonenylene, 5-nonenylene, 6-nonenylene, 7-nonenylene, 8-nonenylene, 1, 3-nonadienylene, 1, 4-nonadienylene, 1, 5-nonadienylene, 1, 6-nonadienylene, 1, 7-nonadienylene, 1, 8-nonadienylene, 2, 4-nonadienylene, 2, 5-nonadienylene, 2, 6-nonadienylene, 2, 7-nonadienylene, 2, 8-nonadienylene, 3, 5-nonadienylene, 3, 6-nonadienylene, 3, 7-nonadienylene, 3, 8-nonadienylene, 4, 6-nonadienylene, 4, 7-nonadienylene, 4, 8-nonadienylene, 5, 7-nonadienylene, 5, 8-nonadienylene, 6, 8-nonadienylene, 1, 3, 5-nonatrienylene, 1, 3, 6-nonatrienylene, 1, 3, 7-nonatrienylene, 1, 3, 8-nonatrienylene, 1, 4, 6-nonatrienylene, 1, 4, 7-nonatrienylene, 1, 4, 8-nonatrienylene, 1, 5, 7-nonatrienylene, 1, 5, 8-nonatrienylene, 1, 6, 8-nonatrienylene, 2, 4, 6-nonatrienylene, 2, 4, 7-nonatrienylene, 2, 4, 8-nonatrienylene, 2, 5, 7-nonatrienylene, 2, 5, 8-nonatrienylene, 2, 6, 8-nonatrienylene, 3, 5, 7-nonatrienylene, 3, 5, 8-nonatrienylene, 3, 6, 8-nonatrienylene, 4, 6, 8-nonatrienylene, 1, 3, 5, 7-nonatetraenylene, 2, 4, 6, 8-nonatetraenylene and the like.

Moreover, examples of the alkynylene available are ethynylene, 1-propynylene, 2-propynylene, 1-butynylene, 2-butynylene, 3-butynylene, 1, 3-butadiynylene, 1-pentynylene, 2-pentynylene, 3-pentynylene, 4-pentynylene, 1, 3-pentadiynylene, 1, 4-pentadiynylene, 2, 4-pentadiynylene, 1-hexynylene, 2-hexynylene, 3-hexynylene, 4-hexynylene, 5-hexynylene, 1, 3-hexadiynylene, 1, 4-hexadiynylene, 1, 5-hexadiynylene, 2, 4-hexadiynylene, 2, 5-hexadiynylene, 3, 5-hexadiynylene, 1-heptynylene, 2-heptynylene, 3-heptynylene, 4-heptynylene, 5-heptynylene, 6-heptynylene, 1, 3-heptadiynylene, 1, 4-heptadiynylene, 1, 5-heptadiynylene, 1, 6-heptadiynylene, 2, 4-heptadiynylene, 2, 5-heptadiynylene, 2, 6-heptadiynylene, 3, 5-heptadiynylene, 3, 6-heptadiynylene, 4, 6-heptadiynylene, 1-octynylene, 2-octynylene, 3-octynylene, 4-octynylene, 5-octynylene, 6-octynylene, 7-octynylene, 1, 3-octadiynylene, 1, 4-octadiynylene, 1, 5-octadiynylene, 1, 6-octadiynylene, 1, 7-octadiynylene, 2, 4-octadiynylene, 2, 5-octadiynylene, 2, 6-octadiynylene, 2, 7-octadiynylene, 3, 5-octadiynylene, 3, 6-octadiynylene, 3, 7-octadiynylene, 4, 6-octadiynylene, 4, 7-octadiynylene, 5, 7-octadiynylene, 1, 3, 5-octatriynylene, 1, 3, 6-octatriynylene, 1, 3, 7-octatriynylene, 1, 4, 6-octatriynylene, 1, 4, 7-octatriynylene, 1, 5, 7-octatriynylene, 2, 4, 6-octatriynylene, 2, 4, 7-octatriynylene, 2, 5, 7-octatriynylene, 1, 3, 5, 7-octatetraynylene, 1-nonylene, 2-nonylene, 3-nonylene, 4-nonylene, 5-nonylene, 6-nonylene, 7-nonylene, 8-nonylene, 1, 3-nonadiynylene, 1, 4-nonadiynylene, 1, 5-nonadiynylene, 1, 6-nonadiynylene, 1, 7-nonadiynylene, 1, 8-nonadiynylene, 2, 4-nonadiynylene, 2, 5-nonadiynylene, 2, 6-nonadiynylene, 2, 7-nonadiynylene, 2, 8-nonadiynylene, 3, 5-nonadiynylene, 3, 6-nonadiynylene, 3, 7-nonadiynylene, 3, 8-nonadiynylene, 4, 6-nonadiynylene, 4, 7-nonadiynylene, 4, 8-nonadiynylene, 5, 7-nonadiynylene, 5, 8-nonadiynylene, 6, 8-nonadiynylene, 1, 3, 5-nonatriynylene, 1, 3, 6-nonatriynylene, 1, 3, 7-nonatriynylene, 1, 3, 8-nonatriynylene, 1, 4, 6-nonatriynylene, 1, 4, 7-nonatriynylene, 1, 4, 8-nonatriynylene, 1, 5, 7-nonatriynylene, 1, 5, 8-nonatriynylene, 1, 6, 8-nonatriynylene, 2, 4, 6-nonatriynylene, 2, 4, 7-nonatriynylene, 2, 4, 8-nonatriynylene, 2, 5, 7-nonatriynylene, 2, 5, 8-nonatriynylene, 2, 6, 8-nonatriynylene, 3, 5, 7-nonatriynylene, 3, 5, 8-nonatriynylene, 3, 6, 8-nonatriynylene, 4, 6, 8-nonatriynylene, 1, 3, 5, 7-nonatetraynylene, 2, 4, 6, 8-nonatetraynylene, and the like.

Further, any hetero atom(s) may exist at an optional position(s) of said alkylene chain. In such cases, $-\text{CH}_2-$ may be changed to $-\text{O}-$, $-\text{S}-$ or $-\text{NR}-$; and $-\text{CH}=\text{CH}-$ may be changed to $-\text{N}=\text{N}-$.

Furthermore, said alkylene may be substituted by one or more of substituents which are identically or differently selected from the group consisting of alkyl, alkenyl, alkynyl, halogen, hydroxy, alkoxy, aryloxy, acyloxy (alkanoyloxy, aroyloxy, etc.), carboxy, ester (alkoxycarbonyl, aralkoxycarbonyl, etc.), cyano, amino, mono- or di-substituted amino, hydroxyamino, alkoxyamino, halogen, nitro, formyl, acyl (alkanoyl, aroyl, etc.), (thio)carbamoyl, (thio) carbamoyloxy, (thio)ureide, sulfonamide, mono- or di-substituted sulfonamide, sulfonic acid and the like. In this case, examples of alkenyl or alkynyl are similar to those illustrated in the definition of alkynylene and alkynylene above.

Examples of the heterocyclic ring of 5 or more members formed by X and Y together with the adjacent nitrogen atom are pyrrole, pyrrolidine, imidazole, pyrazole, 2, 3-dihydroimidazole, 2, 3-dihydropyrazole, 2, 3-

dihydrooxazole, 1, 5-dihydroisoxazole, 2, 3-dihydroisoxazole, 2, 3-dihydrothiazole, 1, 2-dihydropyridazine, 3, 4-dihydropyrimidine, 1, 2-dihydropyrimidine, 3, 4-dihydropyrazine, 1, 2-dihydropyrazine, 1, 2-dihydropyridine and the like. In this case, the group X may be substituted at an optional position by the group:

The present invention includes all the salts that can be formed with a compound of the formula (I). In general, the compound (I) can form a salt with an organic or inorganic acid or an organic or inorganic base. For example, the inorganic base includes alkali metal (sodium, potassium, etc.), alkali earth metal (calcium, magnesium, etc.) and the like, and the organic base includes trimethylamine, triethylamine, pyridine, picoline, N, N-dibenzylethylenediamine, ethanolamine, diethanolamine, tris-hydroxymethyl aminomethane, dicyclohexylamine and the like. The inorganic acid includes illustratively hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid and the like. Examples of the organic acids include formic acid, acetic acid, trifluoroacetic acid, oxalic acid, tartaric acid, fumaric acid, maleic acid, methanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid and the like. The basic or acidic amino acid includes illustratively arginine, lysine, ornithine, aspartic acid, glutamic acid and the like. In particular, the salts with inorganic acids or those with inorganic bases are preferred.

The above-mentioned examples are by no means restrictive and the compounds of the present invention may form pharmacologically acceptable esters and other derivatives. As far as the formed salts, esters and derivatives are substantially non-toxic to warm-blooded animal and convertible into the compound of the present invention in living bodies, they all fall within the scope of the present invention.

The present invention relates to the compound of the formula (Ia)

wherein [A], A, B, R¹, R², R³, X and Y each has the same significance as defined above; or a 5 or more membered heterocyclic ring containing nitrogen atom(s) of the formula (Ib)

wherein X¹-X² has the same significance as X, X¹ represents the ring forming moiety, X² represents the moiety outside the ring, and [A], A, B, R¹, R² and Y each has the same significance as defined above, which is formed when X and Y are combined together with the nitrogen atom.

In the case of the compound of the formula (Ib), the group X can be substituted at an optional position by the group:

The process for preparing the compounds of the present invention will be hereinafter explained.

The compounds (I) of the present invention can be prepared by reacting the compound (IIa) or the compound (IIb) of the following formulae

wherein [A], A, B, R³, X, X¹-X² and Y each has the same significance as defined above with a carboxylic acid activator to give a reactive derivative and allowing the latter to react with a hydroxylamine.

The carboxylic acid activators usable in the reaction with the compound (II) illustratively include thionyl chloride, phosphorus oxychloride, phosphorus pentachloride, alkyl chloroformates (e.g. methyl chloroformate, ethyl chloroformate, etc.), oxalyl chloride, carbodiimides (e.g. N, N-dicyclohexylcarbodiimide (DCC), etc.), hydroxyimides (e.g. N-hydroxybenzotriazole, N-hydroxysuccinimide) and the like. This reaction is generally carried out in the presence of halogenohydrocarbons (e.g. methylene chloride, chloroform, etc.), ethers (e.g. tetrahydrofuran, dioxane, dimethyl ether, diethyl ether, isopropyl ether), N, N-dimethylformamide or a mixture thereof. The reaction is effected at temperature of 0 - 50 °C, preferably around room temperature over a period of 0.5 - 10 hours, preferably 1 - 3 hours.

The acid anhydride, acid halide or active ester obtained by the reaction with the carboxylic acid activator is allowed to react with a hydroxylamine. This reaction is carried out under anhydrous or hydrous conditions in the presence of a deoxidizer such as pyridine, triethylamine, potassium carbonate, sodium carbonate, potassium hydrogencarbonate, sodium hydrogencarbonate or the like in a solvent such as methylene chloride, tetrahydrofuran, dioxane, N, N-dimethylformamide, acetone or the like. The present reaction is effected at temperature of 0 - 50 °C, preferably around room temperature over a period of 0.1 - 10 hours, preferably 0.5 - 2 hours.

The hydroxylamine includes hydroxylamine, N-methylhydroxyamine, O-methylhydroxyamine, and their hydrochloride and sulfate.

The resulting compounds (I) can be isolated by conventional purifying means such as recrystallization, chromatography or the like.

The starting compound (II) can be prepared according to the following processes.

(a) Process A (Synthesis of IIa)

wherein [A], A, B, R³ and Y each has the same significance as defined above, and R⁴ means hydrogen, optionally substituted lower alkyl or aryl group.

(1) In this reaction, a compound a is allowed to react with an acid halide (substituted sulfonic acid halide or substituted carboxylic acid halide) in the presence of a base in a solvent (e.g. tetrahydrofuran, etc.) for sulfonylation or carbonylation to give a compound b. This reaction is effected at temperature of 0 - 50°C, preferably around room temperature over a period of 0.1 - 20 hours, preferably about 1 - 5 hours.

The base usable illustratively includes sodium hydrogencarbonate, potassium hydroxide, sodium carbonate, sodium acetate, triethylamine, pyridine and the like.

The sulfonic acid halide includes benzenesulfonylene chloride and benzenesulfonylene bromide, and the substituted sulfonic acid halide includes methoxybenzenesulfonylene chloride, halogenobenzenesulfonylene chloride, hydroxybenzenesulfonylene chloride, aminobenzenesulfonylene chloride and sulfonic acid derivatives thereof having a desirous substituent such as naphthyl derivative or the like. The carboxylic acid halide includes benzoyl chloride, benzyloxycarbonyl chloride, oxalyl chloride and carboxylic acid derivatives thereof having a desirous substituent.

(2) In this reaction, a compound b is reduced in the presence of a reducing agent in an organic solvent to give a compound c.

The reaction is effected at temperature of 0 - 50°C, preferably around room temperature over a period of 10 hours, preferably 1 - 3 hours.

The solvent usable includes tetrahydrofuran, diethyl ether, methanol, ethanol and the like.

The reducing agent usable is any one of those ordinarily used in the reducing reaction, including lithium aluminum hydride, sodium bis (2-methoxyethoxy) aluminum hydride, diisobutylaluminum hydride, sodium borohydride, lithium borohydride and the like.

(3) In this reaction, a compound c is subjected to an oxidation in the presence of an oxidizing agent, for example, in an appropriate organic solvent to give a compound d.

The reaction is effected at temperature of 0 - 50°C, preferably around room temperature over a period of 0.5 - 5 hours, preferably 1 - 3 hours.

The organic solvent usable includes methylene chloride, acetone and the like, and the methylene chloride is preferred in particular.

The oxidizing agent includes oxalyl chloride-dimethyl sulfoxide, sulfur trioxide-pyridine complex, chromic acid-pyridine complex and dimethyl sulfoxide, and the pyridinium chlorochromate is preferred in particular.

(4) This reaction is well known as Wittig reaction. Thus, a compound d is allowed to react with a phosphonium salt of the formula:

wherein Hal means halogen, R⁷ means an optionally substituted alkylene similar to X as defined above except that the alkylene of R⁷ has one carbon fewer than that of X, said alkylene may contain a hetero atom(s) such as O, S or N or an unsaturated bond(s) in the chain, and R⁸ means hydrogen or a lower alkyl in the presence of a strong base in an inert solvent at temperature of 0 - 50°C, preferably around room temperature for activation. When R⁸ is other than hydrogen, the objective compound (IIa) is

obtained by conventional hydrolysis.

The inert solvent usable illustratively includes toluene, tetrahydrofuran, dimethyl sulfoxide, t-butanol and the like.

Examples of the strong base are potassium *tert*-butoxide, lithium diisopropylamide, sodium hydride, *n*-butyllithium and the like, and the potassium *tert*-butoxide is preferred.

(b) Process B (Synthesis of IIa having alkynylene)

wherein [A], A, B, R³ and Y each has the same significance as defined above, Hal means halogen, X' means ethynylene-X³ (X³ is a single bond or an optionally substituted alkylene, said alkylene may contain a hetero atom(s) such as O, S or N, or an unsaturated bond(s) in the chain and forms a part of X by binding to the ethynylene directly bound to [A]), and R⁵ means -COOR⁴ (R⁴ has the same significance as defined above), -CH₂OR⁶ (R⁶ is an alcohol protecting group) or a functional group convertible into an aldehyde such as -CN or the like.

(1) The compound e is subjected to sulfonylation or carbonylation in the same manner as above to give a compound f.

(2) The compound g is prepared by refluxing a mixture of a compound f, palladium bis-triphenylphosphine dichloride, copper iodide and a terminal acetylenic compound in the presence of a base in an organic solvent for 8 to 48 hours, preferably 10 to 30 hours with heating.

The organic solvent usable includes benzene, toluene, ether, tetrahydrofuran, pyridine, triethylamine and the like.

The base usable includes triethylamine, *N*-methylmorpholine, dicyclohexylamine, pyridine, trimethylamine, diethylamine, *n*-butylamine, diisopropylamine and the like.

(3) The compound h is prepared by reducing the group R⁵ in the form of ester, nitrile or the like of a compound g with lithium aluminum hydride or a related reducing agent thereof, or oxidizing the primary alcohol generated by removing the group R⁵ in the form of an alcohol protecting group under the same conditions as in process A (3) above.

(4) The compound h is subjected to the Wittig reaction under the same conditions as in Process A (4) above to give a compound (IIa).

(c) Process C (Synthesis of IIb)

wherein [A], A, B, X', Y and R⁵ each has the same significance as defined above.

(1) When, as a starting material, a cyclic compound i is used, it is allowed to react in the same manner as in the Process B (3) above to give a compound j.

(2) The compound j is subjected to the Wittig reaction under the same conditions as in the Process A (4) above to give a compound (IIb).

5 When a commercially available compound j is used, the step (1) can be abridged.

The compounds of the present invention, namely the hydroxamic acid derivatives include optically active compound because of the presence of an asymmetric center. Accordingly, the compounds (I) of the present invention means inclusively the both of the optically active compounds and racemic compounds.

The compounds of the present invention can be orally or parenterally administered. In case of oral administration, a compound of the present invention may be formulated into ordinary formulations in the form of solid such as tablets, powders, granules, capsules and the like; solutions; oily suspensions; liquid formulations such as syrups, elixirs and the like. In case of parenteral administration, a compound of the present invention may be formulated into aqueous or oily suspension for injection. In preparing the formulations, conventional excipients, binders, lubricants, aqueous solvents, oily solvents, emulsifiers, suspending agents or the like may be used, and other additives, such as preservatives, stabilizers or the like may also be included.

Although appropriate daily dosage of the compound of the present invention varies depending upon the administration route, age, body weight and conditions of the patient, and the kind of disease to be treated, it can generally be between 0.05 - 1000 mg, preferably 10 - 500 mg on oral administration, and 0.01 - 300 mg, preferably 0.05 - 100 mg on parenteral administration, in 1 - 5 divisions.

The following Examples are provided to further illustrate the present invention and are not to be construed as limiting thereof.

The abbreviations used in the examples have the following meanings: Me = methyl; Et = ethyl; Ph = phenyl; THF = tetrahydrofuran; and DMF = N, N-Dimethylformamide.

Example 1

(6E)-7-(2-Phenylsulfonylamino-phenyl)hepteno-hydroxamic acid (I-1) and (6Z)-7-(2-phenylsulfonylamino-phenyl)hepteno-hydroxamic acid (I-2)

(1) To a suspension of 9.60 g (21.0 mmol) of 5-carboxypentyltriphenylphosphoniumbromide in 80 ml of THF is added 4.58 g (40.8 mmol) of potassium tert-butyrate at 0 °C. After stirring at room temperature for 1 hr, the mixture is cooled again to 0 °C. To the mixture is added a solution of 1.57 g (6.0 mmol) of compound (III-1) in 20 ml of THF. After stirring for 1.5 hr at 0 °C, the reaction solution is partitioned between toluene and water and the aqueous layer is washed with toluene. The aqueous layer is partitioned between methylene dichloride and 2N HCl and the organic layer is washed with water, dried, filtered and concentrated to yield a mixture of compounds (IIa-1) and (IIa-2). When the mixture is separated and purified by column chromatography, 0.860 g (2.39 mmol, yield 40%) of compound (IIa-1) and 0.675 g (1.88 mmol, yield 31%) of compound (IIa-2) are obtained as a pure product.

Compound (IIa-1): m.p. = 116-119 °C.

¹HNMR (CDCl₃) δ: 1.30-1.55 (m, 2H); 1.55-1.78 (m, 2H); 2.10 (dt, J = 6.7, 6.7Hz, 2H); 2.39 (t, J = 7.0Hz, 2H); 5.90 (dt, J = 15.7, 6.5Hz, 1H); 6.12 (d, J = 15.7Hz, 1H); 6.82 (s, 1H); 7.06-7.62 (m, 7H); 7.66-7.84 (m, 2H).

IR (Nujol): 3400-2200, 3270, 1702, 1650.

Elementary analysis (%) for C ₁₉ H ₂₁ NO ₄ S				
Calc.:	C,63.48;	H,5.90;	N,3.90;	S,8.92
Found:	C,63.20;	H,5.92;	N,3.84;	S,8.99.

Compound (IIa-2): m.p. = 82 °C.

¹HNMR (CDCl₃) δ: 1.15-1.65 (m, 4H); 1.92 (dt, J = 7.4, 7.4Hz, 2H); 2.28 (t, J = 7.2Hz, 2H); 5.77 (dt, J = 11.3, 6.9Hz, 1H); 5.90 (d, J = 11.3Hz, 1H); 6.62 (s, 1H); 6.93- 7.30 (m, 3H); 7.35-7.62 (m, 4H); 7.68-7.82 (m, 2H).

IR (Nujol): 3520-2400, 3310, 3140, 1712.

Found:	C,63.38;	H,5.91;	N,3.85;	S,8.62.

(2) To a 4 ml solution of 359 mg (1.0 mmol) of compound (IIa-1) in DMF are added 230 mg (2.0 mmol) of N-hydroxysuccinimide and 412 mg (2.0 mmol) of N,N-dicyclohexylcarbodiimide. After stirring for 4 hr at room temperature, 208 mg (3 mmol) of hydroxylamine hydrochloride and 418 μl (3 mmol) of triethylamine are added and the mixture is further stirred overnight. The reaction mixture is partitioned between ethyl acetate and hydrochloric acid. The organic layer is washed with water (x2) and a saturated saline (x1), dried, filtered and concentrated. Purification by column chromatography on silica gel provides 160 mg (0.427 mmol; yield, 43 %) of the objective compound (I-1).

¹HNMR (DMSO) δ: 1.14-1.40 (m, 2H); 1.40-1.60 (m, 2H); 1.85-2.10 (m, 4H); 6.02 (dt, J = 15.8, 6.6Hz, 1H); 6.39(d, J = 15.8Hz, 1H); 6.90-7.03 (m, 1H); 7.03-7.22 (m, 2H); 7.37-7.70 (m, 6H); 8.68 (s, 1H); 9.69 (brs, 1H); 10.37 (s, 1H).

IR (Nujol): 3700-2080, 1640.

Example 2

(5E)-6-(2-Phenylsulfonylamino-phenyl)hexanoic acid (I-3)

(1) To a suspension of 13.3 g (30 mmol) of 4-carboxybutyltriphenylphosphonium bromide in 100 ml of THF is added 6.6 g (58.8 mmol) of potassium tert-butoxide at 0°C in an atmosphere of nitrogen. After stirring for 40 min at room temperature, the mixture is cooled to -20°C. To the mixture is added gradually 10 ml of a solution of 2.24 g (8.57 mmol) of compound (III-1) in THF over a period of more than 15 min. After the mixture is stirred for 30 min at -15°C, it is warmed up to 0°C over 2 hr while stirring. The reaction mixture is partitioned between toluene and water and the organic layer is washed with water. Aqueous layers are combined and washed with toluene. The organic layer is partitioned between methylene chloride and 2N HCl. The aqueous layer is partitioned between methylene chloride and 2N HCl. The organic layer is washed with water, dried and concentrated. Purification by column chromatography on silica gel and recrystallization provides 2.13 g (6.17 mmol; yield, 72.0 %) of the objective compound (IIa-3).
M.p. = 130-132°C.

$^1\text{H NMR}$ (CDCl_3) δ : 1.76 (quint, $J = 7.1\text{ Hz}$, 2H); 2.18 (dt, $J = 6.8, 7.1\text{ Hz}$, 2H); 2.39 (t, $J = 7.1\text{ Hz}$, 2H); 5.89 (dt, $J = 15.5, 6.8\text{ Hz}$, 1H); 6.15 (d, $J = 15.5\text{ Hz}$, 1H); 6.83 (s, 1H); 7.02-7.65 (m, 7H); 7.65-7.85 (m, 2H).

Example 3

(2E)(4E)-5-(2-Phenylsulfonylaminophenyl)pentadienohydroxamic acid (I-4), (2E)(4E)-N-methyl-5-(2-phenylsulfonylaminophenyl)pentadienohydroxamic acid (I-5) and (2E)(4E)-O-methyl-5-(2-phenylsulfonylaminophenyl)-pentadienohydroxamic acid (I-6)

(1) To a suspension of 14.15 g (31.1 mmol) of 4-ethoxycarbonylene-2-propenylenephosphonium bromide in 200 ml of THF is added 3.38 g (30.1 mmol) of potassium tert-butoxide at 0 °C in an atmosphere of nitrogen. After stirring for 1 hr at room temperature, the mixture is cooled again to 0 °C. To the mixture is added gradually 50 ml of a solution of 2.62 g (10.0 mmol) of compound (III-1) in THF over a period of more than 10 min. After the mixture is stirred for about 1 hr at room temperature, the reaction mixture is partitioned between ethyl acetate and 2N HCl. The organic layer is washed with water and a saturated saline, dried over sodium sulfate, filtered and concentrated under reduced pressure. Purification by column chromatography on silica gel and recrystallization from ether/hexane provides 2.65 g (7.41 mmol); yield, 74 % of the objective compound (IIb-1).

M.p. = 120.5 - 121.5 °C.

¹HNMR (CDCl₃) δ: 1.33 (t, J=7.0Hz, 3H); 4.24 (q, J=7.0Hz, 2H); 5.93 (d, J=15.2Hz, 1H); 6.57 (brs, 1H); 6.62 (dd, J=15.2Hz, 10.2Hz, 1H); 6.77 (d, J=15.2Hz, 1H); 7.13-7.35 (m, 4H); 7.35-7.63 (m, 4H); 7.63-7.80 (m, 2H).

(2) To a 30 ml solution of 2.60 g (7.27 mmol) of compound (IIb-1) in methanol is added 21.8 ml (21.8 mmol) of 1N sodium hydroxide solution and the mixture is stirred for about 3.5 hr. The reaction mixture

is partitioned between ethyl acetate and water. The aqueous layer is partitioned between ethyl acetate and hydrochloric acid and the organic layer is washed with water and a saturated saline, dried over magnesium sulfate, filtered and concentrated. Recrystallization from an ethyl acetate/ether/hexane solvent system provides 2.07 g (6.29 mmol; yield, 87 %) of the objective compound (IIa-4).

M.p. = 241.5 - 243.5 °C.

¹HNMR (DMSO) δ: 5.95 (d, J = 14.6 Hz, 1H); 6.77-7.17 (m, 4H); 7.17-7.35 (m, 2H); 7.41-7.75 (m, 6H); 9.88 (brs, 1H); 12.30 (brs, 1H).

IR (KBr): 3680-2000, 3260, 1676, 1620, 1600, 1330, 1314, 1280, 1168, 1155, 997, 752, 719, 591.

(3) (a) To an 8 ml suspension of 645 mg (1.96 mmol) of compound (IIa-4) in methylene chloride is added 0.60 ml (6.88 mmol) of oxalyl chloride and one drop of DMF. The mixture is stirred for 30 min at room temperature and then for 1 hr at 40 °C and concentrated under reduced pressure to obtain acid chloride. In another vessel, a suspension of 695 mg (10.0 mmol) of hydroxylamine in 12 ml of THF is prepared, which is combined with 8.0 ml of saturated NaHCO₃ solution and stirred for 5 min at room temperature. To the solution is added the previously prepared 8.0 ml of a solution of acid chloride in THF and stirred vigorously for 30 min at room temperature. The reaction mixture is partitioned between ethyl acetate and 2N HCl. The organic layer is washed with water and a saturated saline, concentrated under reduced pressure and allowed to crystallize to obtain 400 mg (1.16 mmol; yield, 59 %) of the objective compound (I-4).

¹HNMR (DMSO) δ: 5.94 (d, J = 14.4 Hz, 1H); 6.73-7.08 (m, 4H); 7.14-7.30 (m, 2H); 7.43-7.74 (m, 6H); 8.99 (brs, 1H); 9.87 (brs, 1H); 10.74 (brs, 1H).

Example 4

(2E)(4E)-5-[2-(N-Methylphenylsulfonylamino)phenyl]-2,4-pentadienohydroxamic acid (I-7)

(1) To a solution of 1.4 g (3.92 mmol) of compound (IIb-1) in 10 ml ethyl acetate is added an ether solution of diazomethane prepared separately. When the yellowish color is no more disappeared, the mixture is concentrated under reduced pressure at temperature below room temperature. Purification of the residue using Lobar column provides 1.15 g (3.10 mmol; yield, 79 %) of the objective compound (IIb-2).

M.p. = 107 - 109 °C.

¹HNMR ($CDCl_3$) δ : 1.34 (d, J = 7.0 Hz, 3H); 3.18 (s, 3H); 4.25 (q, J = 7.0 Hz, 2H); 5.99 (d, J = 15.2 Hz, 1H); 6.71 (dd, J = 7.8, 1.2 Hz, 1H); 6.86 (dd, J = 15.2, 10.8 Hz, 1H); 7.13-7.77 (m, 10H).

IR (Nujol): 1705, 1622, 1544.

Found:	C, 64.61,	H, 5.69,	N, 3.79,	S, 8.51.

(2) To a solution of 320 mg (0.86 mmol) of compound (IIb-2) in a mixture of 4 ml of DMSO and 1 ml of THF is added 1.72 ml (1.72 mmol) of 1 N potassium hydroxide solution and the mixture is stirred for 2 hr. The reaction mixture is partitioned between methyl ethyl ketone and 1N HCl. The organic layer is washed with water and a saturated saline, dried, filtered and concentrated. The residue is dissolved in 5 ml of ethyl acetate and the solution is filtered with Milipore and concentrated. Recrystallization from ether provides 228 mg (0.66 mmol; yield, 77 %) of the objective compound (IIa-5).

M.p. = 188 - 190 °C.

¹HNMR (DMSO) δ : 3.14 (s, 3H); 6.04 (d, J = 15.0 Hz, 1H); 6.73 (dd, J = 7.8, 1.2 Hz, 1H); 7.02- 7.46 (m, 5H); 7.76-7.90 (m, 6H); 12.34 (brs, 1H).

Example 6

(2E)(4E)(6E)-7-(2-Phenylsulfonylaminophenyl)-heptatrieno-hydroxamic acid (I-9)

5

10

15

20 (1) To a 30 ml solution of 1.76 ml (12.6 mmol) of diisopropylamine in THF is added n-butyllithium (1.6 M solution in hexane; 7.90 ml; 12.6 mmol) at -20°C in an atmosphere of nitrogen. After stirring for 20 min at 0°C , the mixture is cooled to -78°C . To the mixture is added dropwise 20 ml solution of 2.68 g (11.4 mmol) of methyl (2E,4E)-6-dimethoxyphosphorylene-2,4-hexadienoate in THF over 20 min. The mixture is stirred for 30 min while maintaining the temperature at -78°C . Thereafter, to the mixture is added dropwise and gradually a 10 ml solution of 0.998 g (3.82 mmol) of compound (III-1) in THF over 15 min at -50°C . The reaction mixture is warmed up to room temperature over about 1.5 hr. then ammonium chloride solution and ethyl acetate are added thereto. The organic layer is washed with a saturated saline, dried, filtered and concentrated. Purification by column chromatography on silica gel and recrystallization from chloroform/methanol provides 0.733 g (1.99 mmol; yield, 52 %) of the objective compound (IIb-4).

25 M.p. = $189.5 - 191^{\circ}\text{C}$.

$^1\text{H NMR}$ (CDCl_3) (400 MHz) δ : 3.77 (s, 3H); 5.93 (d, J = 15.3 Hz, 1H); 6.38 (dd, J = 14.4, 11.2 Hz, 1H); 6.51 (dd, J = 14.4, 10.5 Hz, 1H); 6.54 (s, 1H); 6.55 (d, J = 14.4 Hz, 1H); 6.63 (dd, J = 14.4, 10.5 Hz, 1H); 7.17-7.26 (m, 3H); 7.33 (dd, J = 15.3, 11.2 Hz, 1H); 7.40-7.49 (m, 3H); 7.52-7.58 (m, 1H); 7.69-7.76 (m, 2H).

Example 9

(2E)(4E)-5-(4-Phenylsulfonylamino-phenyl)pentadieno-hydroxamic acid (I-12)

(1) To a 50 ml suspension of 7.08 g (15.5 mmol) of 4-ethoxycarbonylene-2-propenylbenzenetriphenylphosphonium bromide in THF is added 1.68 g (15.0 mmol) of potassium tert-butoxide at 0 °C in an atmosphere of nitrogen and the mixture is stirred for 30 min at room temperature and then cooled again to 0 °C. To the mixture is added dropwise a 15 ml solution of 1.31 g (5.01 mmol) of compound (III-3) in THF over 5 min followed by stirring for 30 min at 0 °C. The reaction is carried out for 3 hr at room temperature and overnight under heating to reflux. The reaction mixture is then

partitioned between ethyl acetate and 2N HCl. The organic layer is washed with water and a saturated saline, dried, filtered and concentrated. Purification by column chromatography on silica gel and recrystallization from ether/hexane/ethyl acetate provides 0.343 g (0.960 mmol; yield, 19 %) of the compound (IIb-7).

M.p. = 166 - 169 °C.

¹HNMR (CDCl₃) δ: 1.31 (t, J = 7.2 Hz, 3H); 4.22 (q, J = 7.2 Hz, 2 H); 5.96 (d, J = 15.2 Hz, 1H); 6.66-6.86 (m, 2H); 6.95 (brs, 1H); 7.02-7.12 (m, 2H); 7.29-7.61 (m, 6H); 7.76-7.86 (m, 2H).

IR (KBr): 3210, 1682, 1623, 1602, 1510, 1470, 1370, 1344, 1332, 1310, 1252, 1155, 1142, 1088, 998, 918, 844, 575.

Example 11

(2E)-(1-Phenylsulfonylindol-2-yl)propenohydroxamic acid (I-15)

(1) To a 50 ml solution of 1.75 ml (10.8 mmol) of trimethyl phosphonoacetate in THF is added at once 0.420 g (10.5 mmol) of 60 % (in oil) sodium hydride at 0 °C in an atmosphere of nitrogen. After stirring for 1 hr at room temperature, a 12 ml solution of 1.03 g (3.62 mmol) of compound (III-5) in THF is added to the mixture gradually. After stirring for 60 min at room temperature, the reaction mixture is partitioned between ethyl acetate and 2N HCl. The organic layer is washed with water and a saturated saline, dried, filtered and concentrated. The residue, when purified by chromatography on silica gel and recrystallized from methylene chloride/ether/hexane, gives 0.872 g (2.55 mmol; yield, 71 %) of the objective compound

(IIb-9).

M.p. = 140 - 142 °C.

¹HNMR (CDCl₃) δ: 3.85 (s, 3H); 6.38 (d, J = 16.0Hz, 1H); 6.98 (s, 1H); 7.21-7.57 (m, 6H); 7.70-7.80 (m, 2H); 8.23 (dd, J = 8.4, 1.0Hz, 1H); 8.39 (dd, J = 16.0, 1.0Hz, 1H).

Example 17

(2E)(4Z)-5-[2-(N-Methylphenylsulfonylaminomethyl)phenyl]-pentadienohydroxamic acid (I-22) and (2E)(4E)-5-[2-(N-methylphenylsulfonylaminomethyl)phenyl]pentadienohydroxamic acid (I-23)

(1) Compound (III-9) is subjected to the Wittig reaction in a manner similar to that set forth in Example 3 (1). The resultant product as a mixture of cis- and trans-isomers is roughly purified by chromatography on silica gel. The resultant mixture is hydrolyzed with potassium hydroxide in a manner similar to that set forth in Example 7 (2) to give a crude product, which is chromatographed on silica gel to remove nonpolar substances.

Recrystallization from ethyl acetate/hexane gives trans-isomer (IIa-20) as a crystal, which is easier to crystalize, leaving cis-isomer (IIa-19) in the mother liquid. The mother liquid, when purified by Lobar column, then dissolving in benzene and concentration again, gives the cis-isomer (IIa-19) as a foam.

Compound (IIa-19): yield, 24 %.

¹HNMR (CDCl₃) δ: 2.53 (s, 3H); 4.13 (s, 2H); 6.02 (d, J=15.2Hz, 1H); 6.49 (t, J=11.4Hz, 1H); 7.15 (d, J=11.4Hz, 1H); 7.21-7.38 (m, 4H); 7.47-7.68 (m, 4H); 7.79-7.89 (m, 2H).

M.p. = 139 - 144°C.

^1H NMR (DMSO) δ : 5.16 (s, 2H); 6.34 (d, J = 16Hz, 1H); 6.74 (d, J = 16Hz, 1H); 7.14-7.64 (m, 9H).

Example 33

(2E)-5-[3'-[3''-(3'', 4''-Dimethoxyphenyl)propenoylamino]phenyl]pent-2-en-4-ynohydroxamicacid (I-41)

5

10

15

20

25

30

To a 25 ml solution of 1.286 g (6.17 mmol) of compound 37 in methylene chloride is added 1.89 ml (21.6 mmol) of oxalyl chloride. The mixture is stirred for 30 min at room temperature and concentrated under reduced pressure to obtain the acid chloride. In another vessel, 30 ml of a solution of 0.400 g (1.27 mmol) of compound (IIb-21) in dioxane is prepared. To the solution are added 200 ml of 0.627 mmol/l NaHCO₃ solution and 18 ml of the previously prepared solution of the acid chloride in dioxane and the mixture is stirred overnight at room temperature. The reaction mixture is partitioned between ethyl acetate and 2N HCl. The organic layer is washed with water, a 5 % NaHCO₃ solution, water, and a saline successively, dried and concentrated. The crude product, when purified by chromatography on silica gel and recrystallized from ethyl acetate/ether/hexane, gives 0.3585 g (0.916 mmol; yield, 72 %) of the objective compound (IIb-32).

M.p. = 127 - 129 °C.

¹HNMR (CDCl₃) δ: 3.79 (s, 3H); 3.92 (s, 6H); 6.31 (d, J = 15.5 Hz, 1H); 6.42 (d, J = 15.5 Hz, 1H); 6.82-7.47 (m, 7H); 7.60-7.87 (m, 3H).

IR (KBr): 3660-3100, 3370, 3000, 2945, 2840, 2195, 1725, 1672, 1652, 1618, 1595, 1580, 1538, 1512.

50

(2) Compound (IIb-32) is hydrolyzed in a manner analogous to that set forth in Example 7 (2) to obtain the objective compound (IIa-36) (yield, 96 %).

55

M.p. = 121 - 122 °C.

¹HNMR (DMSO) δ: 3.81 (s, 3H); 3.83 (s, 3H); 6.36 (d, J = 15.8 Hz, 1H); 6.68 (d, J = 15.6 Hz, 1H); 6.94 (d, J = 15.8 Hz, 1H); 7.02 (d, J = 8.4 Hz, 1H); 7.15-7.29 (m, 3H); 7.40 (t, J = 8.0 Hz, 1H); 7.55 (d, J = 15.6 Hz, 1H); 7.62-7.72 (m, 1H); 7.94 (brs, 1H); 10.28 (brs, 1H).

IR (KBr): 3640-2000, 3360, 2960, 2200, 1690, 1660, 1618, 1548, 1512.

Elementary analysis (%) for $C_{22}H_{19}NO_5 \cdot 0.2H_2O$			
Calc.(%):	C,69.36;	H,5.13;	N,3.68
Found(%):	C,69.24;	H,5.17;	N,3.67

(3) To a solution of 90 mg (0.229 mmol) of compound (IIa-36) in 20 ml of DMF solution are added 35 μ l (0.252 mmol) of triethylamine, 48 mg (0.252 mmol) of WSCD \cdot HCl (1-ethyl-3-(3-dimethylaminopropyl)-carbodiimide hydrochloride) and 26.4 mg (0.229 mmol) of HO-Su (N-hydroxysuccinimide) and the mixture is stirred for 1 hr at room temperature. To the reaction mixture are added 224 μ l (1.61 mmol) of triethylamine and 80.5 mg (1.16 mmol) of hydroxylamine hydrochloride. After stirring for overnight at room temperature, the reaction mixture is partitioned between ethyl acetate and 2N HCl. The organic layer is washed with water and a saturated saline, dried, filtered and concentrated. Because there still remains about half the amount of the starting materials in the reaction mixture, the same procedures are repeated. Thus, to a solution of the reaction mixture in DMF are added 35 μ l (0.251 mmol) of triethylamine, 48.4 mg (0.252 mmol) of WSCD \cdot HCl and 26.9 mg (0.234 mmol) of HO-Su and the mixture is stirred for 1 hr at room temperature. To the reaction mixture are added 224 μ l (1.61 mmol) of triethylamine and 80.5 mg (1.17 mmol) of hydroxylamine hydrochloride. After stirring overnight at room temperature, the reaction mixture is partitioned between ethyl acetate and 2N HCl. The organic layer is washed with water and a saturated saline, dried, filtered and concentrated. The residue is washed with water several times to obtain 16.2 mg (0.041 mmol; purity, 84 % ; yield, about 15 %) of the objective compound (I-41).

1 HNMR (DMSO) δ : 3.81 (s, 3H); 3.83 (s, 3H); 6.36 (d, J=15.8Hz, 1H); 6.60-6.87 (m, 2H); 7.02 (d, J=8.4Hz, 1H); 7.14-7.30 (m, 3H); 7.38 (t, J=7.7Hz, 1H); 7.45-7.73 (m, 2H); 7.96 (brs, 1H); 9.22 (brs, 1H); 10.26 (brs, 1H); 10.88 (brs, 1H).

Mass analysis:

LSIMS m/z = 393 [M + H].

Reference Example 1

(1) To a solution of 25.20 g (0.153 mol) of the starting compound 1 in 600 ml of dioxane are added 800 ml of 5 % $NaHCO_3$ solution and 15 g of $NaHCO_3$ and the mixture is stirred vigorously. An 80 ml solution of 48.7 ml (0.382 mol) of benzenesulfonyl chloride in dioxane is added gradually at room temperature and the resultant mixture is stirred for about 7 hr. The reaction mixture is partitioned between ethyl acetate and 2N HCl. The organic layer is washed with water and a saturated saline, dried over $MgSO_4$ and concentrated to obtain a crude compound 2. Recrystallization from toluene/hexane gives 29.24 g (0.0958 mol; yield, 63 %) of the compound 2.

M.p. = 90 - 92°C.

1 HNMR ($CDCl_3$) δ : 1.36 (t, J=7.2Hz, 3H); 4.33 (q, J=7.2Hz, 2 H); 6.98-7.10 (m, 1H); 7.32-7.58 (m, 4H); 7.64-7.74 (m, 1H); 7.77-7.98 (m, 3H); 10.7 (brs, 1H).

Reference Example 4

(1) To 19.7 g (0.30 mol) of compound 10 is added a solution of 25.2 g (0.30 mol) of sodium hydrogen carbonate in 300 ml of water and the mixture is stirred for 30 min at room temperature. To the mixture is added 50 ml of dioxane to obtain a complete solution, which was added with a 50 ml solution of 15.3 ml (0.12 mol) of benzenesulfonyl chloride in dioxane. After stirring for 1 hr at room temperature, the mixture is partitioned between ethyl acetate and conc. HCl. The organic layer is washed with water and a saturated saline, dried, filtered and concentrated to obtain 33.6 g (0.099 mol; yield, 100 %) of the crude compound 11, which is used in the next reducing reaction without further purification.

(2) To a 300 ml solution of 31.3 g (92.8 mmol) of compound 11 in THF is added 3.53 g (93.0 mmol) of lithium aluminium hydride over a period of more than 1 hr. After stirring for 30 min at room temperature, to the mixture is added 1.77 g (46.6 mmol) of lithium aluminium hydride again. Temperature of reaction

mixture is elevated gradually and the reaction is carried out for 30 min at 40 °C, for 30 min at 45 °C and for 4 hr at 55 °C. After cooling down to 0 °C, ethyl acetate and 2N HCl are carefully added to the mixture in this order to decompose the excess of reagents. The organic layer is washed with water (x2) and a saturated saline (x1), dried, filtered and concentrated. The resultant crude crystalline compound 12, when washed 2 - 3 times with ether, gives 28.0 g (86.6 mmol; yield, 93%) of the compound 12 with relative high purity. The product is used in the next reaction without further purification.

M.p. = 112 - 114 °C.

¹HNMR (CDCl₃) δ (crude crystal): 3.74 (s, 3H); 3.83 (s, 3H); 4.26 (s, 2H); 6.66 (s, 1H); 6.74 (s, 1H); 7.34 (brs, 1H); 7.38-7.64 (m, 3H); 7.66-7.80 (m, 2H).

(3) Compound 12 is reacted in a manner analogous to that set forth in Reference Example 1 (3) to give the objective compound (III-4) (yield, 54 %).

M.p. = 140 - 142 °C.

¹HNMR (CDCl₃) δ: 3.87 (s, 3H); 3.95 (s, 3H); 6.94 (s, 1H); 7.32 (s, 1H); 7.37-7.60 (m, 3H); 7.76-7.90 (m, 2H); 9.64 (s, 1H).

IR (Nujol): 3130, 1650, 1604, 1580, 1519.

Found:	C,66.33;	H,7.28;	N,6.08.

¹HNMR (CDCl₃) δ: 1.28-1.87 (m, 6H); 3.49-3.62 (m, 1H); 3.80-3.94 (m, 1H); 4.69 (d, J = 11.8Hz, 1H); 4.75 (brs, 1H); 4.94 (d, J = 11.8Hz, 1H); 5.96 (brs, 1H); 7.27 (brs, 1H); 7.34-7.52 (m, 3H); 7.74-7.83 (m, 1H).

(3) To a solution of 1.45 g (6.16 mmol) of compound 25 in 15 ml of THF is added dropwise a 15 ml suspension of 468 mg (6.16 mmol x 2) of lithium aluminium hydride in THF at room temperature and the mixture is stirred for 3 hr at room temperature. To the reaction mixture are added slowly ethyl acetate and water, in this order at 0 °C to decompose the excess of reagents, which is followed by the extraction by decantation with ethyl acetate. The organic layer is washed with water and concentrated. The residue is dissolved in 25 ml of methylene chloride. To the solution are added 2.56 ml (6.16 mmol x 3) of triethylamine and 789 μl (6.16 mmol) of benzenesulfonyl chloride at 0 °C and the mixture is stirred for 1 hr at 0 °C. The reaction mixture is partitioned between ethyl acetate and a chilled dilute aqueous solution of oxalic acid. The organic layer is washed with water, a 5 % aqueous NaHCO₃ solution, water, a saturated saline successively, dried and concentrated. The residue, when purified by column chromatography on silica gel, gives 1.34 g (3.71 mmol; yield, 60 %) of the compound 26 as an oil.

¹HNMR (CDCl₃) δ: 1.49-1.90 (m, 6H); 3.48-3.60 (m, 1H); 3.80-3.92 (m, 1H); 4.20 (d, J = 6.4Hz, 2H); 4.43 (d, J = 11.4Hz, 1H); 4.58-4.68 (m, 1H); 4.71 (d, J = 11.4Hz, 1H); 5.84 (t, J = 6.4Hz, 1H); 7.09-7.31 (m, 4H); 7.39-7.59 (m, 3H); 7.79-7.90 (m, 2H).

(4) The compound 26 (1.34 g) is subjected to N-methylation in a manner analogous to that set forth in Example 14 (1) to give a crude product. Purification by column chromatography on silica gel gives 1.17 g (3.11 mmol; yield, 84 %) of the compound 27 as an oil.

¹HNMR (CDCl₃) δ: 1.46-1.92 (m, 6H); 2.58 (s, 3H); 3.46-3.57 (m, 1H); 3.78-3.91 (m, 1H); 4.14 (d, J = 14.0Hz, 1H); 4.36 (d, J = 14.0Hz, 1H); 4.58 (d, J = 12.0Hz, 1H); 4.66-4.72 (m, 1H); 4.80 (d, J = 12.0Hz, 1H); 7.24-7.43 (m, 4H); 7.51-7.68 (m, 3H); 7.83-7.91 (m, 2H).

(5) To a solution of 1.17 g (3.11 mmol) of compound 27 in 20 ml of THF is added 4 ml of 2N HCl and the mixture is stirred for 24 hr. The reaction mixture is partitioned between ethyl acetate and water. The organic layer is washed with a 5 % aqueous NaHCO₃ solution, water, a saturated saline, dried and concentrated. Purification by column chromatography on silica gel gives the compound 28 as an oil, which is crystallized from ethyl acetate/hexane to give 693 mg (2.38 mmol; yield, 76 %) of the compound 28 as a colorless crystal.

M.p. = 79 - 80 °C.

(1) Compound 17 is reacted with tetrahydropyranyloxypent-2,4-diyne in a manner analogous to that set forth in Reference Example 5 (2), to give the compound 31 (yield, 18 %). The product, which contains a little solvent, is used as it is in the next reaction.

^1H NMR (CDCl_3) δ : 1.44-1.95 (m, 6H); 3.48-3.63 (m, 1H); 3.76-3.92 (m, H); 4.40 (s, 2H); 4.84 (t, $J=3.0\text{Hz}$, 1H); 6.95 (brs, 1H); 7.07-7.30 (m, 4H); 7.40-7.63 (m, 3H); 7.75-7.87 (m, 2H).

(2) To a 19 ml solution of 11.67 g (2.95 mmol) of compound 31 in THF is added 4.8 ml of 2N HCl and the mixture is stirred overnight at room temperature. The reaction mixture is partitioned between 5 % sodium hydrogen carbonate solution and ethyl acetate. The organic layer is washed with water, a saturated saline, dried over MgSO_4 and concentrated. The crude product, when purified by column chromatography and recrystallized from methylene chloride/hexane, gives 0.690 g (2.22 mmol; yield, 75 %) of the compound 32 (yield, 75 %).

M.p. = 116 - 117°C.

^1H NMR (CDCl_3) δ : 1.60-2.00 (brm, 1H); 4.42 (s, 2H); 7.00 (brs, 1H); 7.05-7.30 (m, 4H); 7.40-7.63 (m, 3H); 7.72-7.85 (m, 2H).

(3) Compound 32 is reacted in a manner analogous to that set forth in Reference Example 1 (3) to give the compound (III-11). As the product is labile, it is used without further treatment to the next process (in this case, that is described in Example 20).

Reference Example 12

(1) In an atmosphere of nitrogen, to a 300 ml solution of 38.27 g (175 mmol) of m-iodoaniline 16 in methanol is added 47.7 ml (208 mmol) of di-t-butylidicarbonate under ice-cooling. The mixture is stirred overnight at room temperature and the reaction is completed by an additional 4-hour-stirring at 35 °C. The reaction mixture is partitioned between ethyl acetate and 2N HCl. The organic layer is washed with water, a 5 % aqueous NaHCO₃ solution, water, a saturated saline successively, dried, filtered and concentrated. The crude product, when recrystallized from hexane, gives 50.62 g (159 mmol; yield, 92%) of the objective compound 33.

M.p. = 73 - 74 °C.

¹HNMR (CDCl₃) δ: 1.51 (s, 9H); 6.43 (brs, 1H); 6.99 (t, J=8.0Hz, 1H); 7.21-7.30 (m, 1H); 7.32-7.40 (m, 1H); 7.83 (t, J=2.0Hz, 1H).

(2) Compound 33 is reacted in a manner analogous to that set forth in Reference Example 5 (2) using tetrakis(triphenyl)phosphine palladium as a catalyst to obtain a crude product, which is then roughly purified by column chromatography on silica gel to yield the objective compound 34 containing a small amount of impurity (yield, 52 %).

¹HNMR (CDCl₃) δ: 1.52 (s, 9H); 4.47 (s, 2H); 6.53 (brs, 1H); 7.10 (dt, J=7.4, 1.4Hz, 1H); 7.14-7.35 (m, 2H); 7.46-7.54 (brm, 1H).

(3) A solution of 606 ml (85.4 mmol) of dimethyl sulfoxide in 50 ml of methylene chloride is cooled to -50 °C in a dry-ice/acetone bath. To the solution is added dropwise and gradually 3.73 ml (42.8 mmol) of oxalyl chloride and the mixture is stirred for 40 min while maintaining the temperature at -55 °C. To the reaction mixture is added a 100 ml solution of 8.80 g (35.6 mmol) of compound 34 in methylene chloride over a period of more than 20 min and the stirring is continued for another 40 min at -55 °C. Finally, 14.88 ml (107 mmol) of triethylamine is added gradually and, five minutes later, the dry-ice/acetone bath is removed. The reaction mixture is stirred for 45 min to warm up to room temperature and partitioned between ethyl acetate and 2N HCl. The organic layer is washed with water, a 5 % NaKCO₃ solution, a saturated saline, dried, filtered and concentrated. The crude product, when purified by chromatography on silica gel and recrystallized from ethyl acetate/hexane, gives 7.88 g (32.1 mmol; yield, 90 %) of the objective compound (III-12).

M.p. = 154 - 156 °C.

¹HNMR (CDCl₃) δ: 1.53 (s, 9H); 6.55 (brs, 1H); 7.22-7.30 (m, 2H); 7.34 (dd, J=7.4, 0.5Hz, 1H); 7.44 (dt, J=7.4, 2.1Hz, 1H); 7.68-7.76 (brm, 1H); 9.41 (s, 1H).

The activity of the compounds prepared in the foregoing Examples was evaluated using the method described in the following experimental examples.

Experiment 1

Assay of Inhibition Against the Cell Growth of Vascular Endothelial Cells of Human Umbilical Vein

Human vascular endothelial cells used had been obtained from human umbilical vein by perfusion method using an enzyme solution of collagenase and have been maintained by subculturing in a culture solution, i.e., M199 medium (Gibco, Inc.) supplemented with 20% fetal bovine serum (FBS; Gibco, Inc.), 100 $\mu\text{g/ml}$ endothelial mitogen (Funakoshi), 90 $\mu\text{g/ml}$ heparin, 50 IU/ml Penicillin and 50 $\mu\text{g/ml}$ Streptomycin. A 100 μl suspension of 1×10^4 human vascular endothelial cells in M199 medium containing 20% FBS was seeded in 96-well plate (Sumitomo Bakelite, MS-9096F) and cells were grown in a gas thermostat. On the next day, to each well was added 10 μl of a medium containing a sample at various concentrations. The sample was prepared by dissolving a test compound in dimethyl sulfoxide (DMSO) and diluting the solution with the medium so as to make the final concentration of DMSO less than 0.25 %. After 3-day-incubation, to the mixture was added 50 μl of 3 mg/ml MTT solution (a solution of 3-(4,5-dimethyl-2-thiazolyl)-2,5-diphenyl-2H-tetrazolium bromide dissolved in a culture solution) and the incubation was continued for 4 hr. Cells and MTT pigment were solubilized by the addition of 50 μl of 20 % SDS solution (sodium dodecylsulfate dissolved in 0.02N HCl) and the incubation continued for 1 hr, which was followed by the determination of OD₅₇₀ value on spectrophotometer. Each sample was evaluated as to the inhibition activity against the cell growth of endothelial cells by assuming the OD value obtained in the control experiment, which was carried out in the same manner in the absence of a sample, to be 100 %, calculating the concentration (IC₅₀) of each compound which gives 50 % OD value of that obtained in control group and comparing the IC₅₀ values. The results are shown in Table 1 below.

Table 1

Compound Number	MTT Method (IC ₅₀ μM)
I-9	25.6
I-10	20.4
I-18	13.8
I-19	26.7

Experiment 2

Assay of Inhibition Activity Against Cell Adhesion of Leukocytes onto Vascular Endothelial Cells of Human Umbilical Vein

Human vascular endothelial cells used had been obtained from human umbilical vein by perfusion method using an enzyme solution of collagenase and have been maintained by subculturing in a culture solution, i.e., M199 medium (Gibco, Inc.) supplemented with 20% fetal bovine serum (FBS; Gibco, Inc.), 100 $\mu\text{g/ml}$ endothelial mitogen (Funakoshi), 90 $\mu\text{g/ml}$ heparin, 50 IU/ml Penicillin and 50 $\mu\text{g/ml}$ Streptomycin. HL60 cells (human myelocytic leukemia cells) were purchased from Flow, Inc. and have been maintained by subculturing in RPMI1640 medium containing 10% FBS.

A 200 μl suspension of 1×10^4 human vascular endothelial cells suspended in Dulbecco's Modified Essential Medium (DMEM) was seeded in 96-well plate (Sumitomo Bakelite, MS-9096F) and cells were grown in a gas thermostat. Four hours later, to each well was added 4 μl of a medium containing a sample at various concentrations. The sample was prepared by dissolving a test compound in DMSO and diluting the solution with a medium so as to make the final concentration of DMSO less than 0.25 %. After 16-hour-incubation, 4 μl of 1×10^4 $\mu\text{g/ml}$ TNF solution (tumor necrosis factor dissolved in a medium solution) was added and the incubation was continued for 4 hr. The resultant medium solution containing the sample was then filtered with suction and washed (x3) with DMEM solution containing 10 % FBS, which was followed by the addition of 200 μl suspension of 3×10^5 HL-60 cells suspended in DMEM containing 10 % FBS. The incubation was carried out at 37°C for 30 min. The supernatant was removed by aspiration, which was followed by washing (x2) with DMEM solution containing 10 % FBS and the addition of 100 μl of 0.25% Rose Bengal solution (dissolved in phosphate-buffered physiological saline). After being allowed to stand for 5 min at room temperature, the supernatant was removed by aspiration, which was followed by washing (x2) with DMEM solution containing 10 % FBS. A mixture of ethanol/phosphate-buffered physiological saline

(1:1) was added and the resultant mixture was allowed to stand for 30 min to solubilize Rose Bengal pigment, which was followed by the determination of OD₅₇₀ value on spectrophotometer. The inhibition activity against the cell adhesion of leukocytes to endothelial cells was evaluated by assuming the OD value obtained in the control experiment, which was carried out in the same manner in the absence of a sample, to be 100 %, calculating the concentration (IC₅₀) of each compound which gives 50 % OD value of that obtained in control group and comparing the IC₅₀ values. The results are shown in Table 2 below.

Table 2

Compound Number	IC ₅₀ (μM)
I-7	4.5
I-9	6.5
I-10	5.3
I-11	6.4
I-17	8.3
I-18	2.5
I-19	6.3

Medium used: 9.5 g of Dulbecco's Eagle MEM medium (Nissui Seiyaku) solution, 20 ml of 7 % sodium hydrogen carbonate solution are added to distilled water and a fetal bovine serum (Flow Laboratories, Inc.) was added to a final concentration of 10 v/v % to obtain the medium. The medium (100 μl) was added to a 96-well plate (Sumitomo Bakelite) and NIH3T3 cells transformed by ras gene (5×10³ cells/well) were seeded. The plate was incubated for 24 hr in a 5 % carbon dioxide gas incubator. Then a sample to be tested was added in such a manner as to give 2-fold serial dilutions. After 24 hours, cells were observed morphologically to evaluate the detransformation activity. The results are shown in Table 3 below.

Table 3

Minimum Concentration Required for the Detransformation of Cells Transformed by Ras Gene	
Compound Number	MTC (μM)
I-4	1.6
I-7	0.20
I-9	3.2
I-10	0.30

I-12	3.1
I-17	3.2
I-18	0.039
I-19	0.30
I-20	0.60

Industrial Utility

As can be seen from the above, the compounds of the present invention possess the inhibitory activities against the growth of vascular endothelial cells and the expression of lymphocyte adhesive factors and the detransforming activity by ras gene, and inhibit the cell growth and are effective on inflammation and tumor.

Claims

1. A compound of the formula (I)

wherein [A] represents each optionally substituted aromatic ring or aromatic heterocyclic ring; A represents hydrogen or each optionally substituted aryl or aromatic heterocyclic ring group; B represents a single bond or a bivalent group of $-\text{B}_1-\text{B}_2-$, wherein B_1 represents $-\text{CO}-$ or $-\text{SO}_2-$ and B_2 represents alkylene, alkenylene, alkyleneoxy or alkenyleneoxy; X represents optionally substituted alkylene, said alkylene optionally containing a hetero atom(s) selected from O, S or N in the chain and further optionally containing an unsaturated bond(s); Y represents a single bond, a hetero atom or optionally substituted alkylene, said alkylene optionally containing a hetero atom(s) in the chain and optionally containing an unsaturated bond(s); and X and the nitrogen atom adjacent to Y may form a 5 or more membered heterocyclic ring containing nitrogen atom(s) represented by the formula below:

- R^1 , R^2 and R^3 each independently represents hydrogen or optionally substituted lower alkyl group or aryl group or pharmaceutically acceptable salts thereof.
2. The compound as claimed in Claim 1, wherein 5 or more membered heterocyclic ring containing nitrogen atom(s) is pyrrole.
 3. An antitumor agent which contains the compound (I) as claimed in Claim 1 together with a pharmaceutically acceptable carrier therefor.
 4. An anti-inflammatory agent which contains the compound (I) as claimed in Claim 1 together with a pharmaceutically acceptable carrier therefor.
